

Be aware that the current setting values for these current sources are not quite the simple system that you thought it was, i.e. the feedback resistance sinks some of the current from the virtual GND as well as the resistor that goes up to real GND.

Adjust the TRACK_CC trim such that the bandpass output peaks when all the faders are set at opposite ends of their travel. This will give you -3dB at the 'Nyquist point' out of the LF tracking filter. Do this at A440.
